

Ex.No:5

Study of Agile project management tools.

Aim:

To manage the Automated Form-Filling System using IT Project Management techniques and Agile Project Management tools.

Procedure:

1. **Select an Agile Project Management Tool**

Select an open-source or freely available Agile project management tool such as **Taiga, OpenProject, or Jira.**

2. **Create a Project**

Create a new project and enter the project name, description, team members, and project objectives.

3. **Create Product Backlog**

Identify the project requirements and add them as **User Stories** or tasks in the product backlog.

4. **Prioritize User Stories**

Arrange the backlog items according to their importance and assign priorities such as **High, Medium, and Low.**

5. **Create a Sprint**

Create a sprint with a fixed duration, usually 1–4 weeks, and select the required user stories from the product backlog.

6. **Assign Tasks**

Divide each user story into smaller tasks and assign them to the respective team members.

7. **Track Task Progress**

Use an Agile **Kanban/Scrum board** with columns such as:

8. To Do

9. In Progress

10. Testing

11. Done

12. **Monitor Sprint Progress**

Track completed and pending tasks using the sprint board, progress indicators, or burndown chart.

13. Conduct Daily Stand-up

Review what was completed, what is currently being worked on, and any issues or blockers.

14. Perform Sprint Review

At the end of the sprint, review the completed work and demonstrate the developed features.

15. Conduct Sprint Retrospective

Identify what went well, what went wrong, and what improvements should be made in the next sprint.

16. Generate Project Report

Review the project status, completed tasks, pending tasks, sprint progress, and overall project performance.

Output:

The screenshot shows the mx application interface. At the top is a blue navigation bar with the 'mx' logo, a home icon, and links for 'Home', 'Users', and 'Forms'. The main content area has a light blue background. It starts with the heading 'Welcome to your homepage'. Below this is a section titled '1 Define and organize your data' with a subtext: 'Start by setting up your Domain Model, where you define the data structure for your app. This includes creating entities, attributes, and associations.' A white box titled 'Domain model' contains a diagram showing two entities: 'YourEntity' and 'YourEntity2'. 'YourEntity' has attributes 'Endpoint (String)' and 'authKey (String)'. 'YourEntity2' has attributes 'UUID (String)' and 'Status (enumeration)'. They are connected by a bidirectional association labeled 'YourEntity2_YourEntity'. Below the diagram, text states: 'A well-structured Domain Model forms the foundation for the components and pages you'll build next.' and a link '→ Learn more' is provided.

Result:

Thus, the Agile project management tool was successfully studied and used to create a project, manage the product backlog, plan sprints, assign tasks, track progress, and monitor Agile project activities.
